SYNTHETIC BUILDING RULES

CODECRAFT 3D — Test Document BR-SYN-001 | Version 1.0

SYNTHETIC TEST DATA — NOT AN OFFICIAL BUILDING REGULATION. All values and clauses are invented solely to test software. Do not use for construction, permitting, design approval, or legal compliance.

1. Purpose and scope

This fictional document defines measurable constraints for a hypothetical rectangular residential plot. It is designed to test document ingestion, AI extraction, page-level evidence references, deterministic calculations, and 3D visualization.

2. Test plot

Assume a rectangular plot with a width of 20 metres and a depth of 30 metres. The plot area is 600 square metres. The road is along the front boundary.

3. Illustrative constraints

Clause	Test constraint	Illustrative value
SYN-01	Minimum plot area	150 m2
SYN-02	Front setback	3 m
SYN-03	Side setback (each side)	1.5 m
SYN-04	Rear setback	2 m
SYN-05	Maximum building height	12 m
SYN-06	Maximum ground coverage	60% of plot area

These values are invented and are not based on any municipality, state, national building code, or real authority.

4. Clause wording for extraction

SYN-01 — Minimum plot area

A plot used in this synthetic test scenario must have an area of at least 150 square metres. A plot below 150 square metres fails this illustrative test constraint.

SYN-02 — Front setback

The building must be placed at least 3 metres behind the front plot boundary. The front boundary is the side adjoining the road in the worked example.

SYN-03 — Side setbacks

A minimum clear distance of 1.5 metres must be maintained from each side plot boundary to the nearest building wall.

SYN-04 — Rear setback

A minimum clear distance of 2 metres must be maintained between the rear plot boundary and the nearest building wall.

SYN-05 — Maximum building height

The total building height must not exceed 12 metres, measured vertically from the assumed ground reference level to the highest roof point.

SYN-06 — Maximum ground coverage

The building footprint must not occupy more than 60 percent of the total plot area. For the 600-square-metre example plot, this illustrative limit equals 360 square metres.

5. Test interpretation notes

The software may extract each clause as a candidate constraint and attach the relevant page number and supporting text. Evidence validation should check whether the cited page and excerpt exist. Passing this check confirms source traceability only; it does not establish legal applicability or regulatory compliance.

6. Expected safety behaviour

No extracted candidate from this synthetic document is approved for automatic real-world geometry changes. Label the document as synthetic, keep candidates in a test or review state, and require explicit human confirmation before any geometry update.

End of synthetic test document. Document ID: BR-SYN-001.
